Turbo super wetting

Your customers simply require the excellence

The correct desizing of new textiles is an essential focus for most laundries

Why use Turbo super wetting ? Because...

- New textiles receive specific treatments during manufacture which can lead to chemical reactions (yellowing...) during washing processes but also skin irritations.
- Fibres coming from different geographical areas and sources contain chemical substances which will be released in the washing liquor and can react with detergents.
- Some desizing treatments are responsible for quality issues in finishing when ironing or drying through a tunnel dryer.
- Due to the type of chemistry applied on new textiles during their manufacture, some soiling is absorbed and then extremely difficult to remove.
- The correct desizing process will avoid any derma tological reaction when using a new textile.
- Creating and using the correct desizing process will directly save time and money by avoiding production issues.

Turbo super wetting

The insurance of a perfect finishing quality

A poor desizing procedure will cause creases and wrinkles after finishing of the textiles. The right process with Turbo super wetting will ensure a good removal of the desizing treatment and in the end a perfect finishing quality.

> Comparison between a process with Turbo super wetting (right part) and without (left part). Both pieces have been ironed using the same equipment.

No chemical reaction between desizing chemicals and washing detergents

Not removing desizing chemistry from new textiles will lead to a typical yellowing of the item but also possible irritations to sensitive persons. With Turbo super wetting, you avoid this kind of issues.

"Sizing of textile has always existed but significant difficulties appeared only a few years ago. The entire indusrty faces this issue. Sometimes numerous washing cycles are required to remove the sizing treatment but this is absolutely neccessary as a stiff industry product cannot be supplied to a new customer" Technical director comment from a French textile leasing company.

The textile on the left has been treated with Turbo super wetting before washing using a standard white workwear process. The textile on the right has not.

Use recommendations for a perfect desizing process

Pre-wash : Conditioner forte 5-10 ml/kg + Turbo super wetting 5-10 ml/kg ; 60-70°C ; 15-30 minutes ; bath ratio 1:6

Main-wash : Turbo break 15-20 ml/kg + Oxybrite Perfekt 10 ml/kg + Conditioner forte 5-10 ml/kg + Turbo super wetting 5-10 ml/kg ; 80°C ; 20-30 minutes ; bath ratio 1:5
